

## **Anouk van Breukelen**

Anouk van Breukelen is a PhD student at Wageningen University working on the PPS project Climate Smart Cattle Breeding (2020-2024). In the project it is being investigated whether breeding for lower methane emissions from dairy cattle is possible, and work is being done towards implementation of a breeding value for methane in the Dutch national breeding program. The project contributes to reducing the effect that agriculture has on climate change, while continuing to provide food with high nutritional value to the growing world population
